

## CLAIMS

We claim:

1. A data collection and reporting method comprising the steps of, in a central system:  
receiving a report concerning at least one parameter from at least one sender;  
automatically extracting report data from the report and storing the extracted  
5 report data in a memory;  
for at least one third party, storing a set of party-specific rules in the memory;  
associating the received report with the corresponding third party; and  
via a publicly accessible transmission network, allowing access by the third party  
to at least a selected portion of the extracted report data according to that third party's  
10 corresponding party-specific rules.

2. A method as in claim 1, further comprising the step of transferring a copy  
of the extracted report data to the third party via the network, whereby the transferred  
data resides at and is available for processing by the third party.

3. A method as in claim 2, further comprising the following steps:  
storing the extracted data in the memory in a predetermined common format;  
before transferring the extracted data to any third party, converting the extracted  
data into a format specified by the rules associated with that third party, whereby third  
5 parties operating different hardware platforms and processing software may receive and  
process extracted data from the same memory within the central system.

4. A method as in claim 1, further comprising the step of storing in the  
memory third-party indicated annotations associated with the extracted report data.

5. A method as in claim 1, further comprising the following steps:  
receiving, from the third party, a confirmation or rejection indication relating to at  
least a portion of the extracted, stored report data; and  
upon receipt of the rejection indication, directing the sender to resubmit a  
corrected report.

6. A method as in claim 1, further comprising the following steps:  
storing an image of the report as received; and  
via the network, allowing access by the third party to the image, whereby the  
third party is able to confirm the accuracy of the extracted report data.

7. A method as in claim 1, further including the following steps:  
associating at least one fourth party with the sender and with at least one of the  
third parties; and  
via the network, allowing access by a fourth party to at least a selected portion of  
the extracted report data from the respective sender.

8. A method as in claim 7, in which:  
the third party is an agency;  
the fourth party is a client of the agency;  
the sender is a person referred by the agency to the client and performs work  
tasks for the client; and  
the at least one parameter is time worked by the sender on behalf of the client.

9. A method as in claim 1, in which the report is a physical form, further  
comprising the steps of, within the central system:  
automatically receiving from any of a plurality of the senders, via a transmission  
channel, an electronic representation of an image of the physical form, the form having  
a plurality of data fields, each corresponding to an indicator of at least a partial value of  
at least one of the parameters;  
automatically identifying the location of the data fields in the received

representation of the image of the form;

10 automatically extracting from the identified data fields the at least partial values of the corresponding parameters; and

automatically storing the extracted values in a predetermined common format in the memory for subsequent processing.

10. A method as in claim 9, in which the electronic representation of the image of the physical form is generated using a conventional facsimile machine, whereby the transmission channel is a standard telephone line.

11. A method as in claim 9, further including the step of transferring the stored extracted values to the third party via the network, all processing of the physical form after transmission by the sender up to and including transfer to the third party via the network thereby taking place automatically.

12. A data collection and reporting method comprising the steps of, in a central system:

receiving a report concerning at least one parameter from at least one sender;  
extracting report data from the report and storing the extracted report data in a

5 memory in a predetermined common format;

for at least one third party, storing a set of party-specific rules in the memory;

associating the received report with the corresponding third party;

converting the extracted data into a format specified by the rules associated with  
that third party, whereby third parties operating different hardware platforms and  
processing software may receive and process extracted data from the same memory  
within the central system;

via a publicly accessible transmission network, allowing access by the third party  
to at least a selected portion of the extracted report data according to that third party's  
corresponding party-specific rules;

15 transferring a copy of the extracted report data to the third party via the network,  
whereby the transferred data resides at and is available for processing by the third  
party;

associating at least one fourth party with the sender and with at least one of the  
third parties;

20 via the network, allowing access by a fourth party to at least a selected portion of  
the extracted report data from the respective sender;

in which:

the third party is an agency;

the fourth party is a client of the employment agency;

25 the sender is a person referred by the agency to the client and performs work  
tasks for the client; and

the at least one parameter is time worked by the sender on behalf of the client.

13. A method as in claim 12, further comprising the following steps:  
receiving, from the third party, a confirmation or rejection indication relating to at  
least a portion of the extracted, stored report data; and  
upon receipt of the rejection indication, directing the sender to resubmit a  
5 corrected report.

14. A method as in claim 12, further comprising the following steps:  
storing an image of the report as received; and  
via the network, allowing access by the third party to the image, whereby the third party  
is able to confirm the accuracy of the extracted report data.

15. A data collection and reporting system comprising  
a central system that includes:

I/O means for automatically receiving from any of a plurality of senders, via a  
transmission channel, a report concerning at least one parameter from at least one of  
5 the senders;

form processing means:

for extracting report data from the report and for storing the extracted  
report data in a memory;

10 for at least one third party, for storing a set of party-specific rules in the  
memory;

for associating the received report with the corresponding third party; and  
via a publicly accessible transmission network, for allowing access by the  
third party to at least a selected portion of the extracted report data according to that  
third party's corresponding party-specific rules.

16. A system as in claim 15, in which the form processing means includes pull  
request processing means for transferring a copy of the extracted report data to the  
third party via the network, whereby the transferred data resides at and is available for  
processing by the third party.

17. A system as in claim 16, in which the form processing means further includes format conversion means:

for storing the extracted data in the memory in a predetermined common format; and

5 before transferring the extracted data to any third party, for converting the extracted data into a format specified by the rules associated with that third party, whereby third parties operating different hardware platforms and processing software may receive and process extracted data from the same memory within the central system.

18. A method for doing business comprising the following steps:  
receiving a report concerning at least one parameter from at least one sender;  
extracting report data from the report and storing the extracted report data in a memory;

5 for at least one third party, storing a set of party-specific rules in the memory;  
associating the received report with the corresponding third party;  
via a publicly accessible transmission network, allowing access by the third party to at least a selected portion of the extracted report data according to that third party's corresponding party-specific rules; and

10 charging the third party for the access.
